

Clean and run Windows update

1. Turn on Automatic Update from Program->Start->control panel->AutomaticUpdate. Run CleanAndUpdateWindows.cmd file. This will remove the conficker virus, remove the share folder. Will run the SymantecAntivirus.exe tool from Symantec. This tool will remove any virus that is not detected by EConfickerRemover. Will run the windows update if missing.

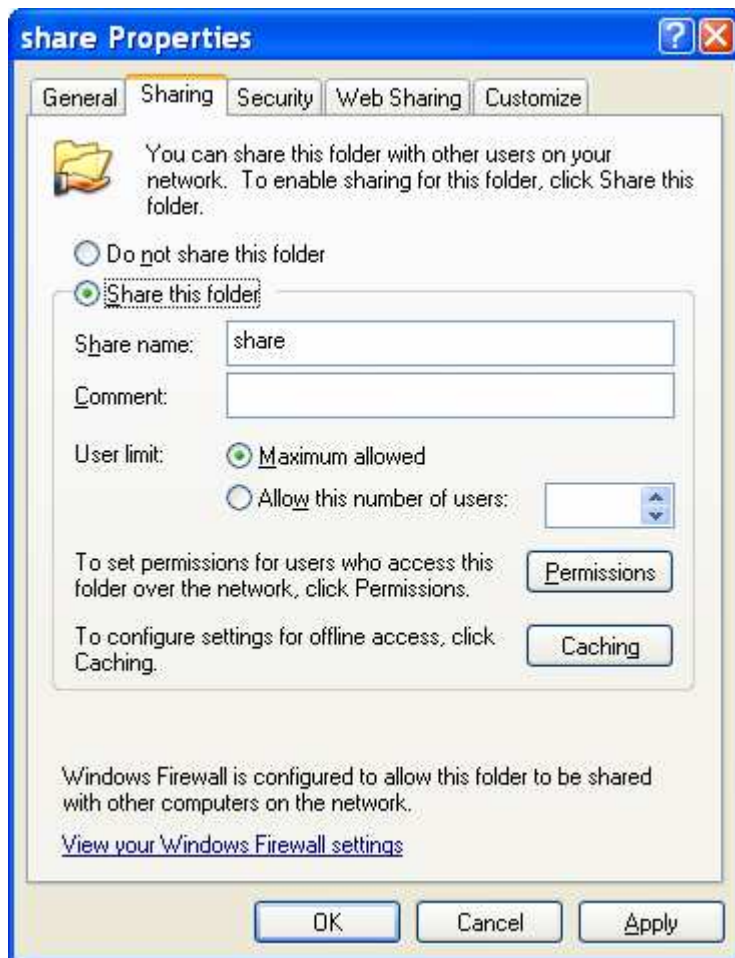

2. Run %windir%\windowsupdate.log from the program-start to see what windows updates are being installed

3. Turn off the windows Automatic update as shown in the picture above, after the script is complete, otherwise this will kick in update every week, which is not required.

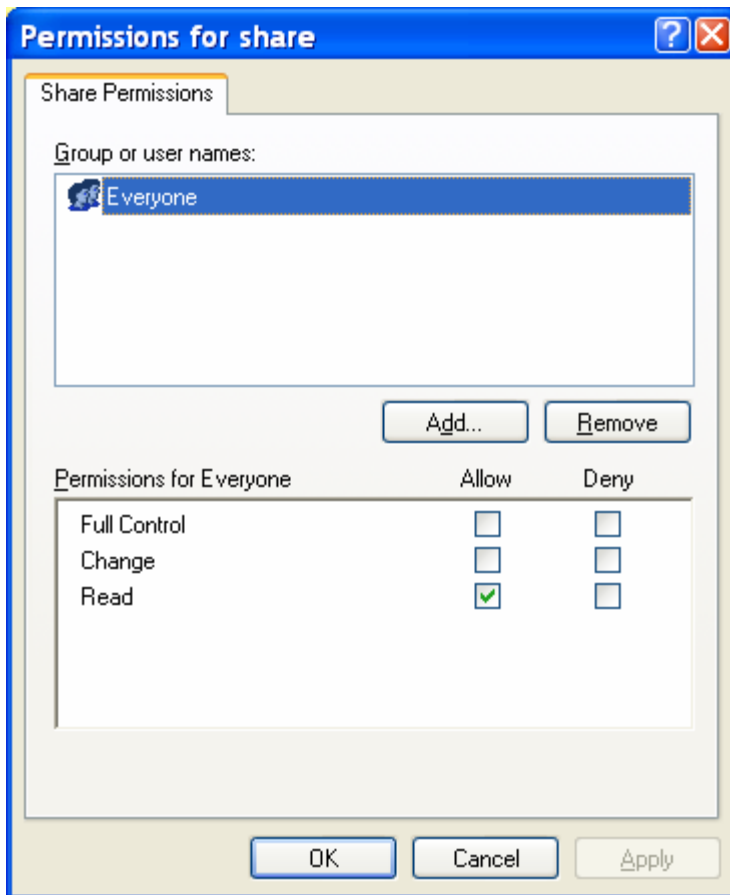

To setup the share folder with the permission follow the steps below.

1. Run MicrosoftFixIt50053.msi file. Follow the wizard steps. This will change the folder option to have simple file sharing option.

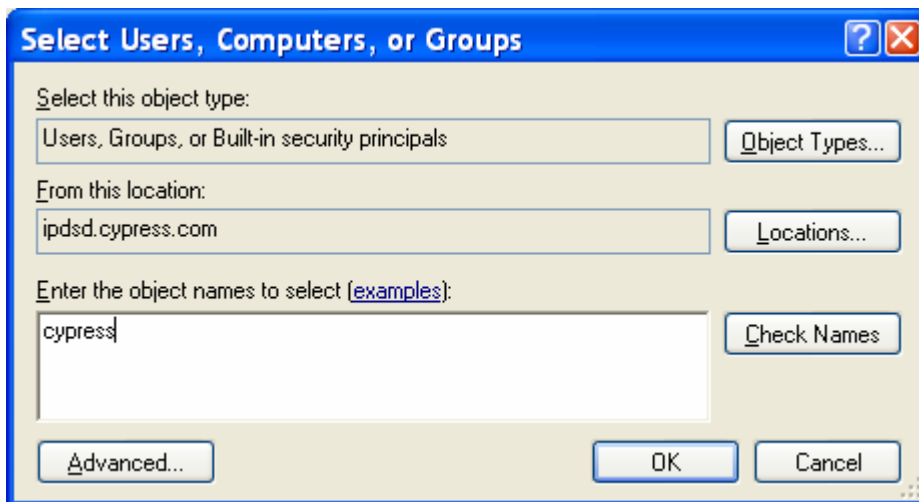

2. Now right click on the share folder and select properties. Select Share this folder. Select "Permissions" button

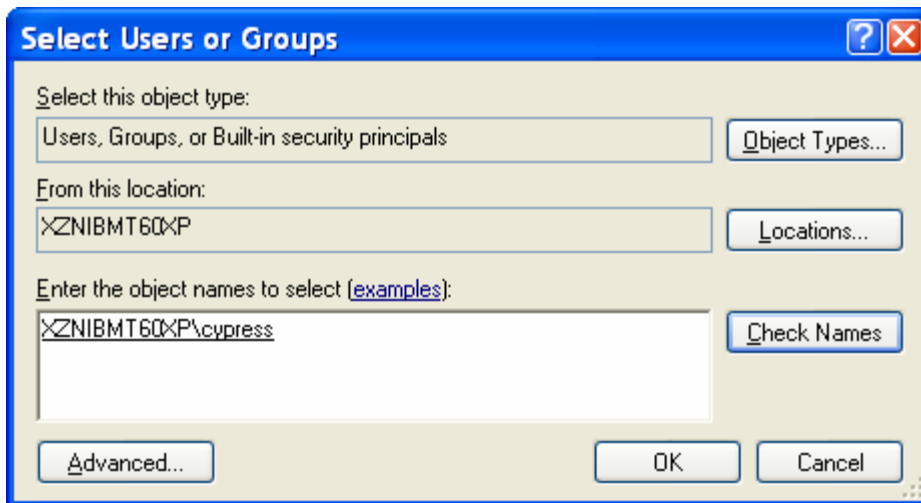

3. Remove Everyone from the Group or user names. Select "Add"

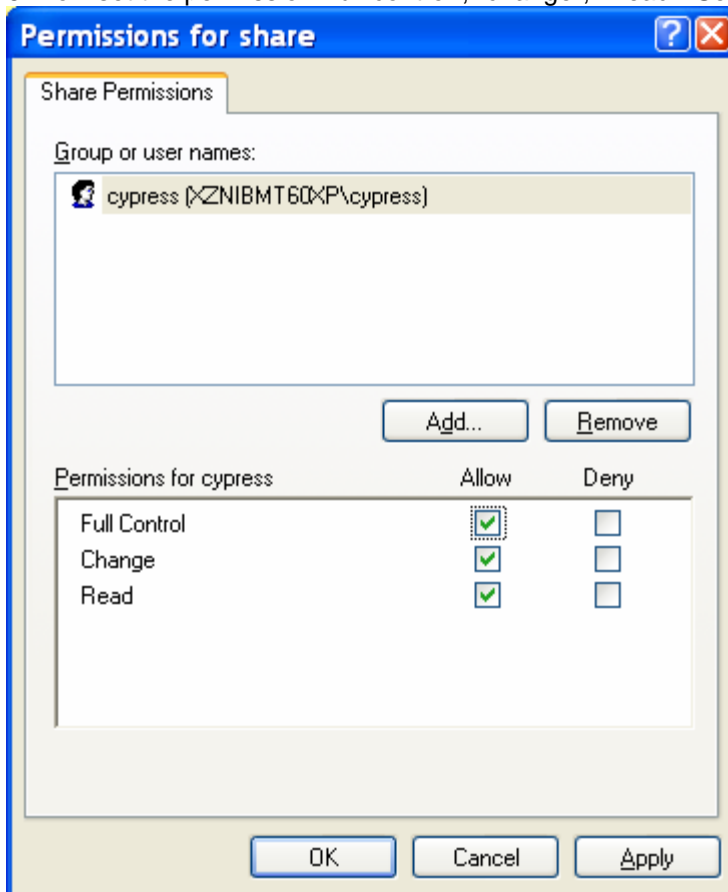

4. Enter the user "cypress" in the "Enter the object names to select". Then select "check names"

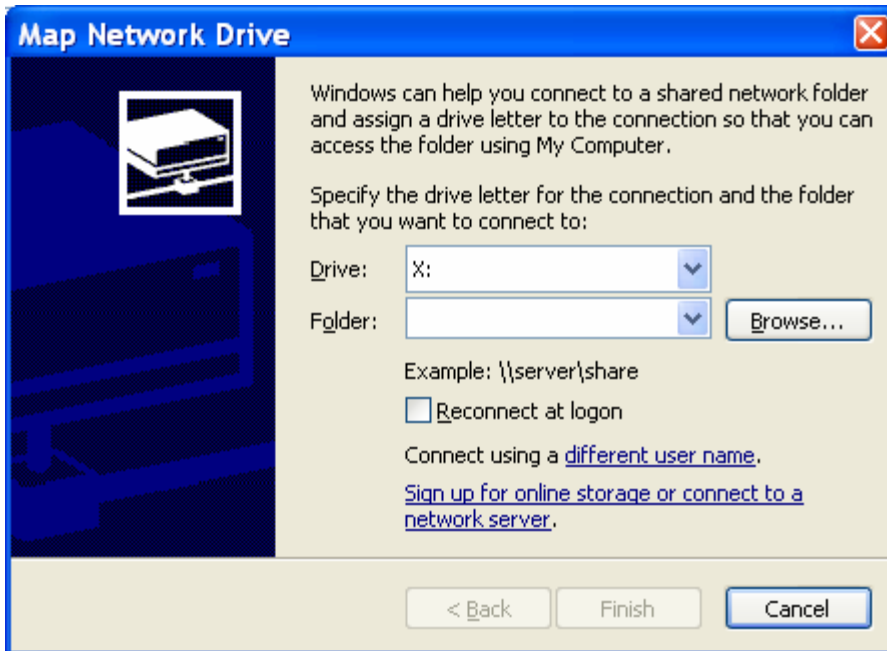

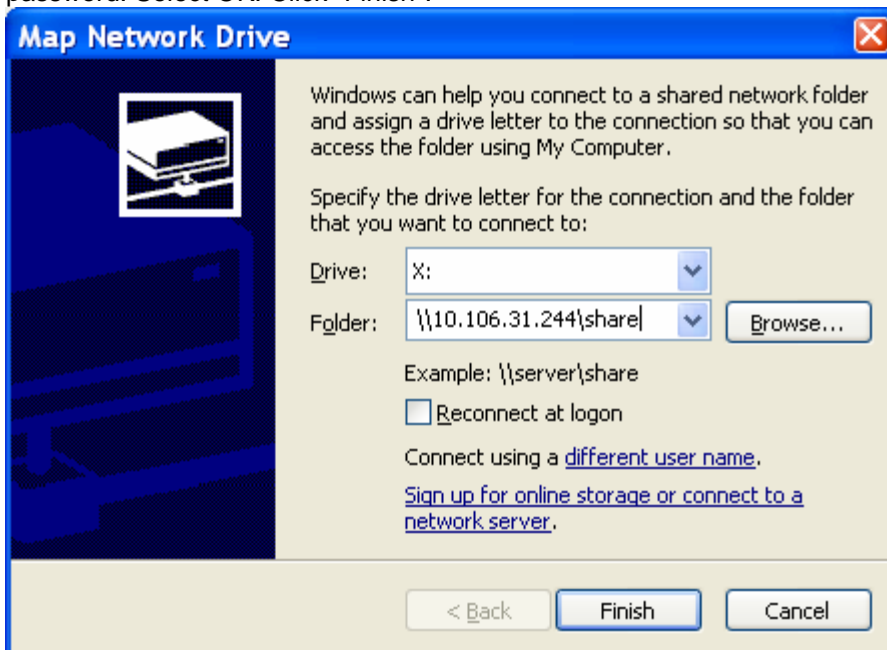

5. Now set the permission "full control", "change", "Read". Select OK.

6. With this now the share folder is shared as "Share" with permission for only "cypress" user.
7. To access this folder from the any machine on the network, user has to map the drive. Follow next steps for that
8. Select File explorer. Select "Tools- Map Network drive"

9. type the share drive name. Then select "different user name". Enter the user name and password. Select OK. Click "Finish".

10. Now a new drive is created with the remote folder shared.
